1. Progress made thus far
    a. So far, we have been able to preprocess our data so we can determine the aspect weight and aspect ratings. We were also able to determine the seed words in order to create our aspect segmentation and we will be using this when creating the rating regression.
2. Remaining tasks
    a. We have to still implement the rating regression model and determine if we were able to reproduce similar results to the research paper. We also need to finish implementing the sentiment analysis on each aspect which will lead to the creation of the aspect rating.
3. Any challenges/issues being faced
    a. Right now we are struggling with determining the term weights and trying to find an algorithm which will accurately assign weights to each term. We are looking into some of the lecture videos for additional help and will reach out to our TA if we are still struggling.
